## Introduction

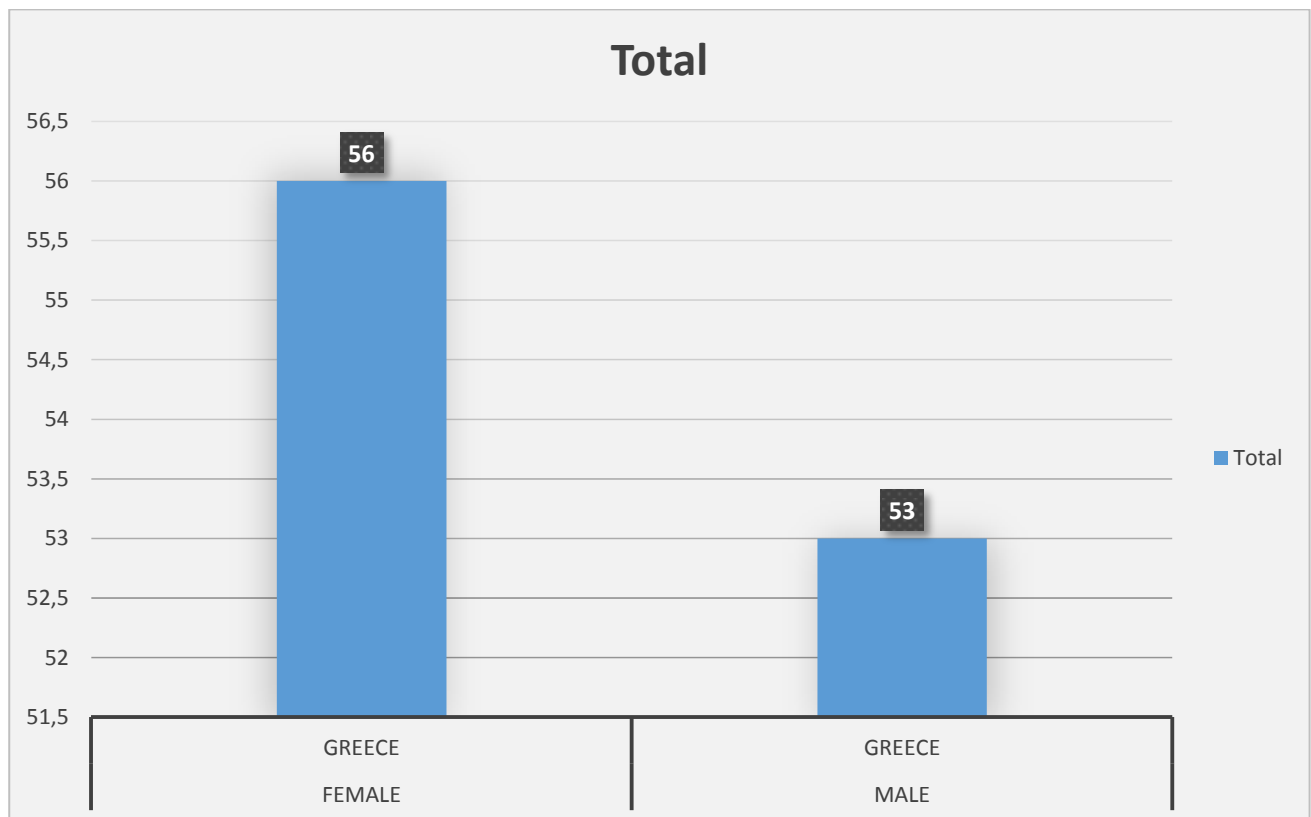

The current document contains the analysis of the results from the questionnaires that have been developed under the Project “WORLD OF PHYSICS LEARN / PLAY / HAVE FUN!” (ERASMUS + 2016-1-CY01-KA201-017371) in Greece. It contains the statistical analysis of the answers to questions addressed in questionnaires that were distributed to the participants to the piloting activities conducted in the project (109 respondents, about 32% from all the respondents at the project level). Its main purpose is to provide a comprehensive feedback regarding the use of the WOP 3D World platform and the learning materials therein. The feedback is used to improve the content, graphics, layout, learning methodologies and user interactivity within the 3D World, following the piloting activities in the project.

The main aim of the WOP project is to assist students in better studying and learning physics with the utilization of new educational technologies. Specifically, a 3D virtual reality educational environment has been developed, possessing innovative educational infrastructure, and offering immersive and efficient learning opportunities, engaging students in various educational activities, learning scenarios and offering students an attractive, entertaining and efficient way to learn various topics of the challenging domain of physics. The students are offered the ability to virtually visit laboratories, perform experiments, explore procedures and phenomena, examine the ways that are conducted and also be guided towards analyzing and explaining them through the scientific method. The virtual educational environment and the laboratories have been designed in a way that offer a support to students to develop appropriate mental models of the concepts involved, by visualizing them and allowing interactions with the virtual phenomena and processes. When students learn new abstract concepts, it is quite hard without appropriate connection to concrete examples. The 3D virtual reality educational environment and the visualization of procedures are aiming to help students to connect abstract concepts and procedures to concrete experiences and examples, including spatial instruction. Also, by teaching the students to study in 3D virtual reality and by using visualization techniques, it is aimed to enhance the spatial cognition.
